技术规格

Background:	The human glucocorticoid receptor DNA binding factor, which associates with the promoter region of the glucocorticoid receptor gene (hGR gene), is a repressor of glucocorticoid receptor transcription. The amino acid sequence deduced from the cDNA sequences show the presence of three sequence motifs characteristic of a zinc finger and one motif suggestive of a leucine zipper in which 1 cysteine is found instead of all leucines.
Applications:	WB
Name of antibody:	ARHGAP35(Phospho-Tyr1105)
Immunogen:	Peptide sequence around phosphorylation site of Tyrosine

	1105 (N-I-Y(p)-S-V) derived from Human GRF-1.
Full name:	Rho GTPase activating protein 35
