技术规格

Background:	cdc25C is highly conserved during evolution and it plays a key role in the regulation of cell division. Th e encoded protein is a tyrosine phosphatase and be longs to the Cdc25 phosphatase family. It directs de phosphorylation of cyclin B-bound CDC2 and trigger s entry into mitosis. It is also thought to suppress p 53-induced growth arrest. Multiple alternatively splic ed transcript variants of this gene have been descri bed, however, the full-length nature of many of the m is not known.
