技术规格

Background:	This gene encodes a transcription factor with multiple homeodomains and zinc finger motifs, and regulates myogenic and neuronal differentiation. The encoded p protein suppresses expression of the alpha-fetoprotein gene by binding to an AT-rich enhancer motif. The protein has also been shown to negatively regulate c-M yb, and transactivate the cell cycle inhibitor cyclin-dependent kinase inhibitor 1A (also known as p21CIP1).
Applications:	IHC
Name of antibody:	ZFH3
Immunogen:	Synthesized peptide derived from internal of human Z FHX3.
Full name:	zinc finger homeobox 3
