技术规格

Background:	This gene encodes a member of the dual specificit y protein kinase family, which functions as a mito gen-activated protein (MAP) kinase kinase. MAP ki nases, also known as extracellular signal-regulated kinases (ERKs), act as an integration point for mult iple biochemical signals. This protein phosphorylat es and activates p38 MAP kinase in response to in flammatory cytokines or environmental stress. As a n essential component of p38 MAP kinase mediat ed signal transduction pathway, this gene is involv ed in many cellular processes such as stress induc
	ed in many cellular processes such as stress induc ed cell cycle arrest, transcription activation and ap optosis.
