技术规格

Background:	The protein encoded by this gene is a member of the d4 domain family, characterized by a zinc finger-like structural motif. This protein functions as a transcription factor which is necessary for the apoptotic response following deprivation of survival factors. It likely serves a regulatory role in rapid hematopoietic cell growth and turnover. This gene is considered a candidate gene for multiple endocrine neoplasia type I, an inherited cancer syndrome involving multiple parathyroid, enteropancreatic, and pituitary tumors.
Applications:	ELISA, WB
Name of antibody:	DPF2
Immunogen:	Fusion protein of human DPF2

Full name:	D4, zinc and double PHD fingers family 2
